Waldenström's Macroglobulinemia – first described by Jan Gosta Waldenström in 1944.

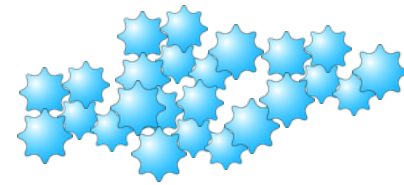

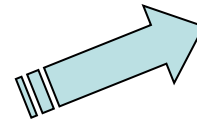

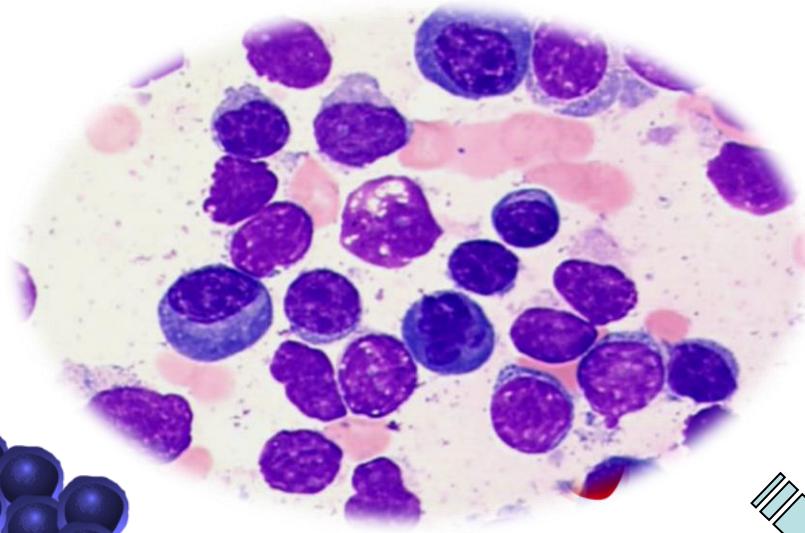

# Lymphoplasmacytic Lymphoma

- Cellular Morphology: lymphocytes, lymphoplasmacytic cells, plasma cells
- BM Pattern: interstitial with diffuse or nodular infiltrates with excess mast cells associated with lymphoid aggregates.
- LN/SP: diffuse pattern

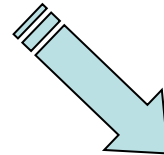

# Manifestations of WM Disease

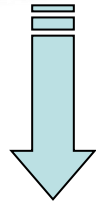

↓HCT, ↓PLT, ↓WBC

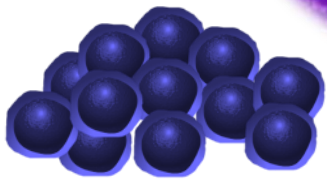

Hyperviscosity Syndrome:  
Nosebleeds,  
headache,  
Impaired vision  
>4.0 CP

IgM Neuropathy (22%)  
Cryoglobulinemia (10%)  
Cold Agglutininemia (5%)

Hepcidin  
↓Fe Anemia

Adenopathy,  
splenomegaly  
≤20% (at Dx)

Treon, Hematol Oncol 2013

# NCCN Guidelines for Initiation of Therapy in WM

- Hemoglobin  $\leq 10$  g/dL on basis of disease
- Platelets  $< 100,000$  mm<sup>3</sup> on basis of disease
- Symptomatic hyperviscosity
- Moderate/severe peripheral neuropathy
- Symptomatic lymphadenopathy or hepatosplenomegaly
- Symptomatic cryoglobulins, cold agglutinins, autoimmune-related events, amyloidosis
- Symptomatic extramedullary disease (kidney, lungs, central nervous system, etc.)

Kyle, Semin Oncol 2003

Anderson, JNCCN 2016.

# Rituximab

## Characteristics

- Anti-CD20 monoclonal antibody
- CD20 is expressed in all B-cells, normal and malignant
- Activates the immune system to kill cancer cells
- Accumulates in the body

## Treon et al (2001)

- N=30, retrospective study
- 1-11 infusions; single agent
- IgM went from 2400 to 1500 mg/dl
- Bone marrow involvement went from 60% to 15%
- 60% response rate

Treon J Immunother 2001

# Rituximab

## Dimopoulos et al (2002)

- N=17; prospective
- 4 weekly doses; repeat at 3 months
- 40% response rate
- Time to response was 3 months
- Time to progression was 16 months

Dimopoulos Clin Lymphoma 2002

## Treon et al (2005)

- N=29; prospective
- 4 weekly doses; repeat at 3 months
- 65% response rate
- Time to best response was 17 months

Treon Ann Oncol 2005

# Rituximab

## Adverse events

- Infusions reactions
- Increased risk of infections
- Low blood counts
- Hepatitis B reactivation

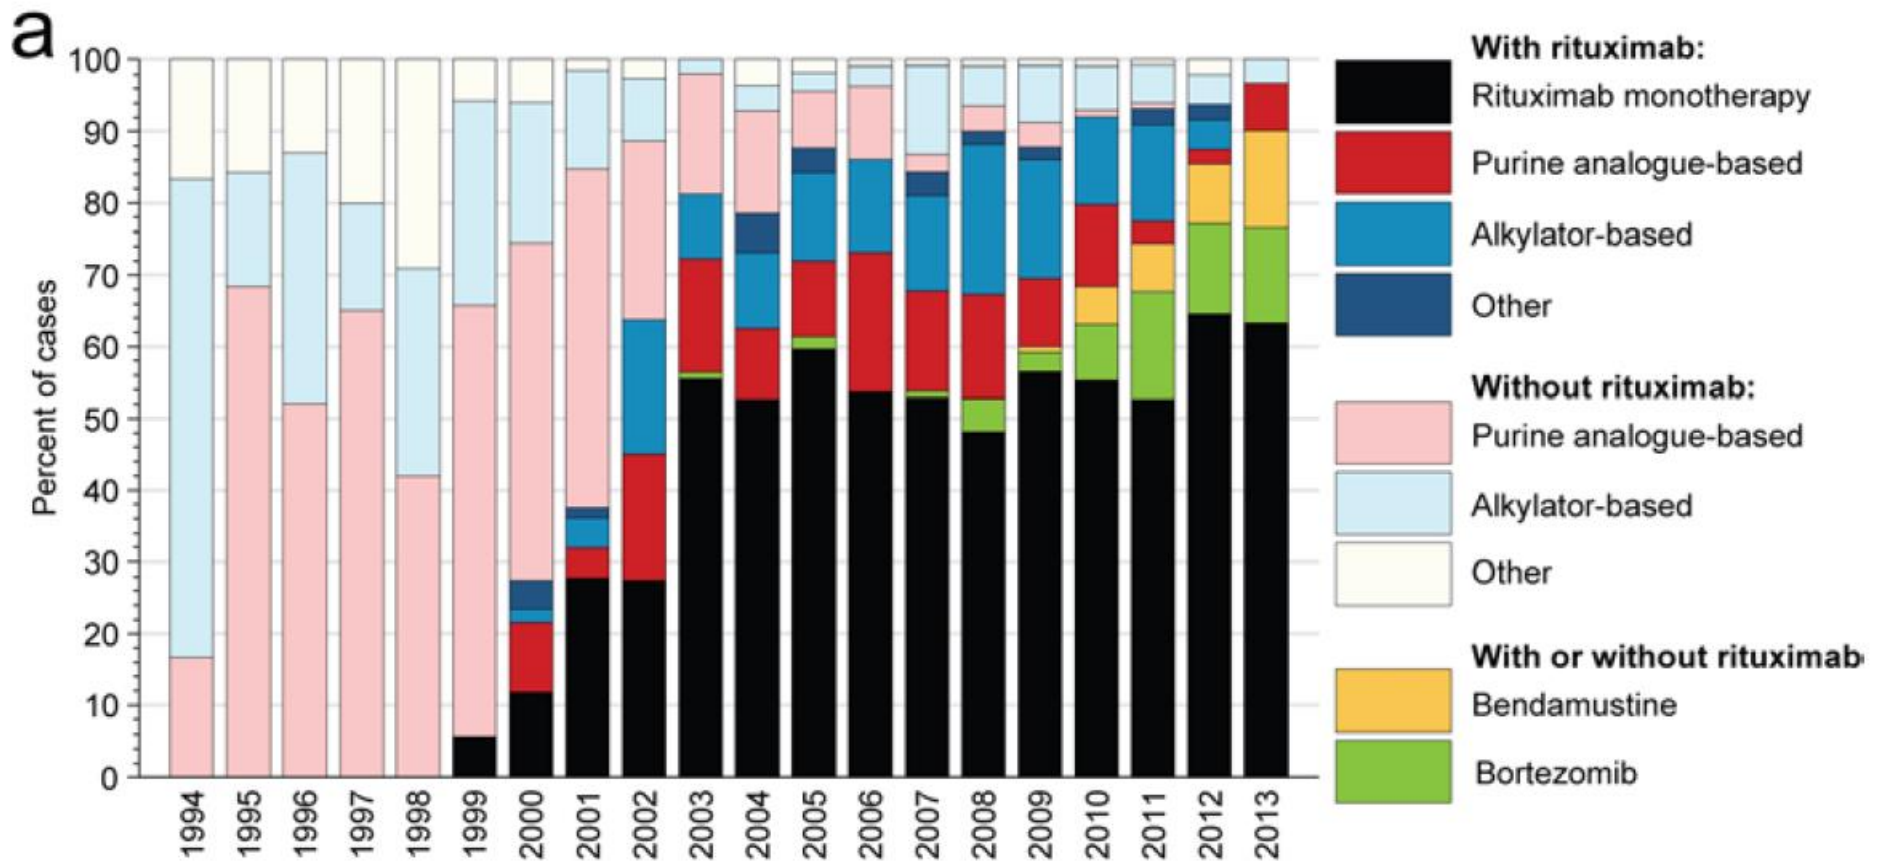

## Disadvantages

- Delayed responses
- IgM flare
  - 40% of patients
  - Avoid Rituximab until IgM in “safe range”
- Rituximab Intolerance
  - 7% of patients
  - Consider Ofatumumab

Treon Ann Oncol 2004

Castillo Br J Haematol 2016

# Hot off the press!

Olszewski Oncologist 2016

# Cyclophosphamide-Based Therapy

## Greek experience

- N=72; untreated
- Cyclophosphamide/Dexamethasone/Rituximab
- ORR 83%
- CR 7%
- Median PFS 3 years

## A German study

- N=64; untreated
- R-CHOP (n=34) vs. CHOP (n=30)
- Response: R-CHOP 94%; CHOP 67%
- Time to failure: R-CHOP 63 months; CHOP 22 months

Dimopoulos J Clin Oncol 2007  
Kastritis Blood 2015

Buske Leukemia 2009

# Cyclophosphamide-Based Therapy

## Disadvantages

- Hair loss
- Low blood counts
- Nausea and vomiting
- Increased risk of infections
- Secondary leukemia ~1%

# Proteasome inhibitor-based therapy

## Mechanism of action

- Targets the proteasome, among others
- Proteasome is the garbage disposal of the malignant cell
- “Trash” accumulates in the cell and forces it to die

## Chen et al (2007)

- N=27
- Bortezomib: IV twice weekly
- ORR: 70%
- CR: 0%
- Nodal response lagging
- Time to response: 2 cycles

Chen J Clin Oncol 2007

# Proteasome inhibitor-based therapy

## Treon et al (2009)

- BDR; N=25
- Bortezomib: IV twice weekly
- ORR 96%
- CR 12%
- Progression-free survival 66 months

## Dimopoulos (2015)

- N=59
- Bortezomib: IV weekly
- First cycle without rituximab
- ORR: 85%
- CR: 3%
- Progression-free survival 42 months

Treon, JCO 2009

Treon, ASH 2015

Dimopoulos, Blood 2013

# Disadvantages

- Peripheral neuropathy
  - Less when given weekly or SC instead of IV
- Low platelet counts
- Steroids
- Zoster prophylaxis
  - Acyclovir or valacyclovir

# Proteasome inhibitor-based therapy

## Carfilzomib

- CARD; N=31
- Intravenous twice weekly
- ORR 87%
- CR 3%
- Less neuropathy (<5%)
- Responses less durable in patients with lymphadenopathy

## Disadvantages

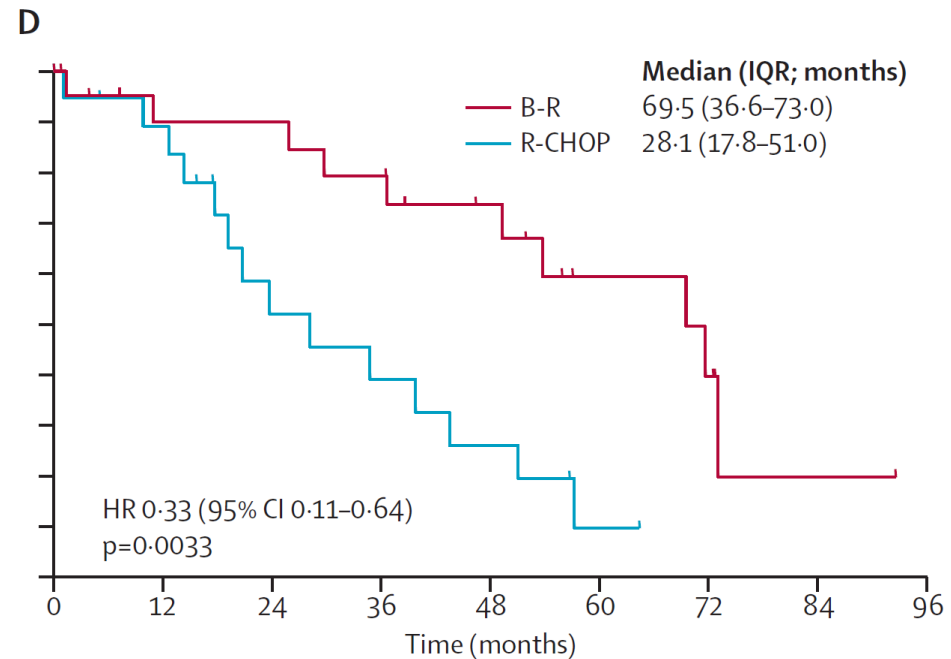

- Increases glucose and cholesterol
- Hypogammaglobulinemia
- Heart problems: HTN, CAD
- Steroids
- Zoster prophylaxis

Treon, Blood 2014

# Bendamustine and rituximab

## Another German study

- Bendamustine-R (N=22) vs. CHOP-R (N=19)
- Good option for patients with lymphadenopathy or enlarged liver/spleen
- ORR 80%
- Progression-free survival 69 months

Rummel, Lancet 2013

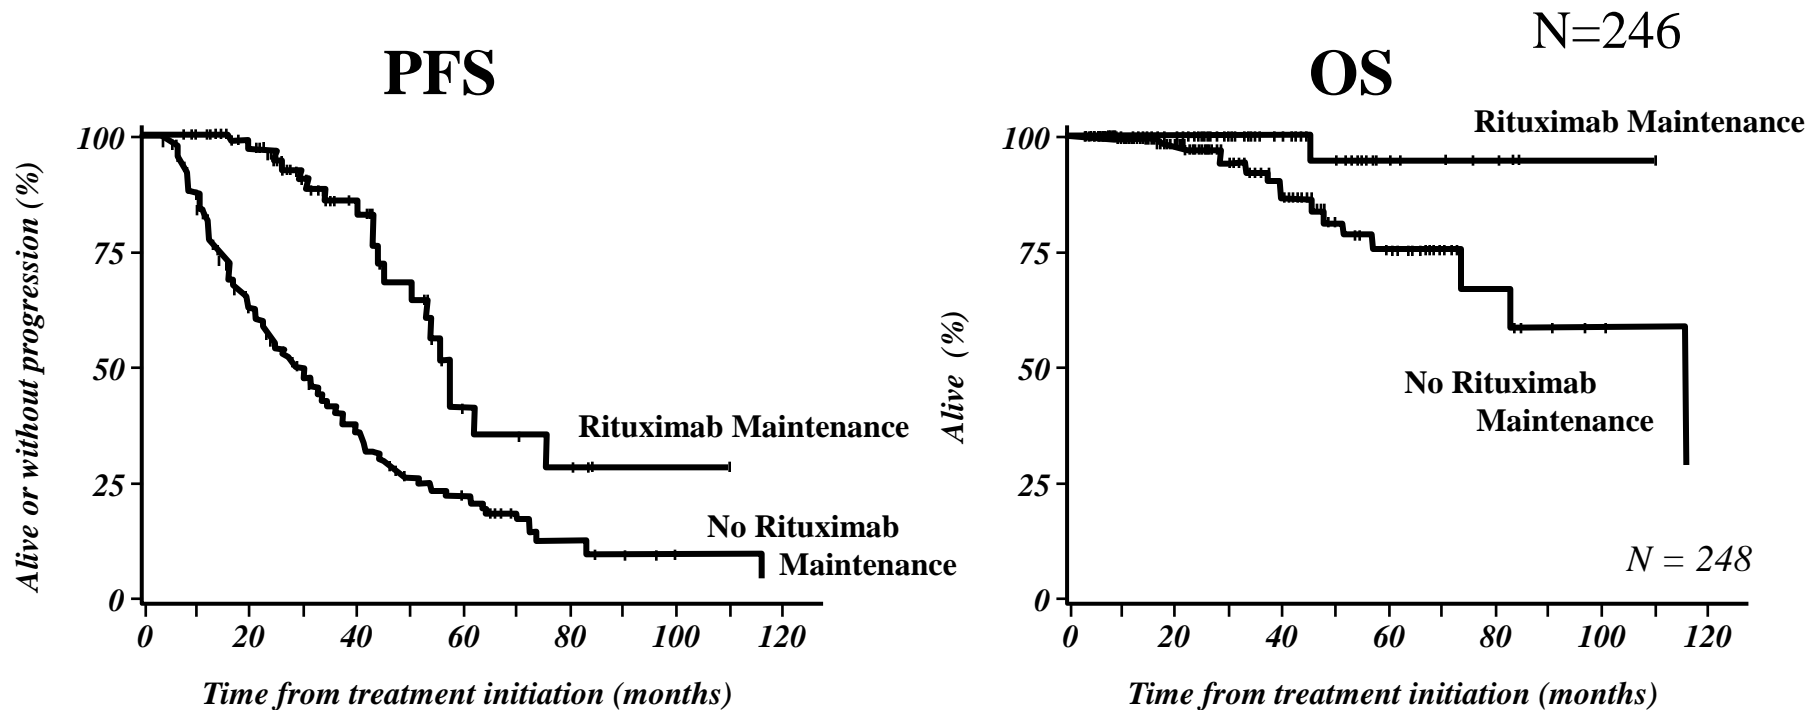

# Disadvantages

- Potential stem cell toxicity
- Low blood counts
- Infusion reactions
- 1/200 chances of secondary leukemia

# To Maintain or Not to Maintain?

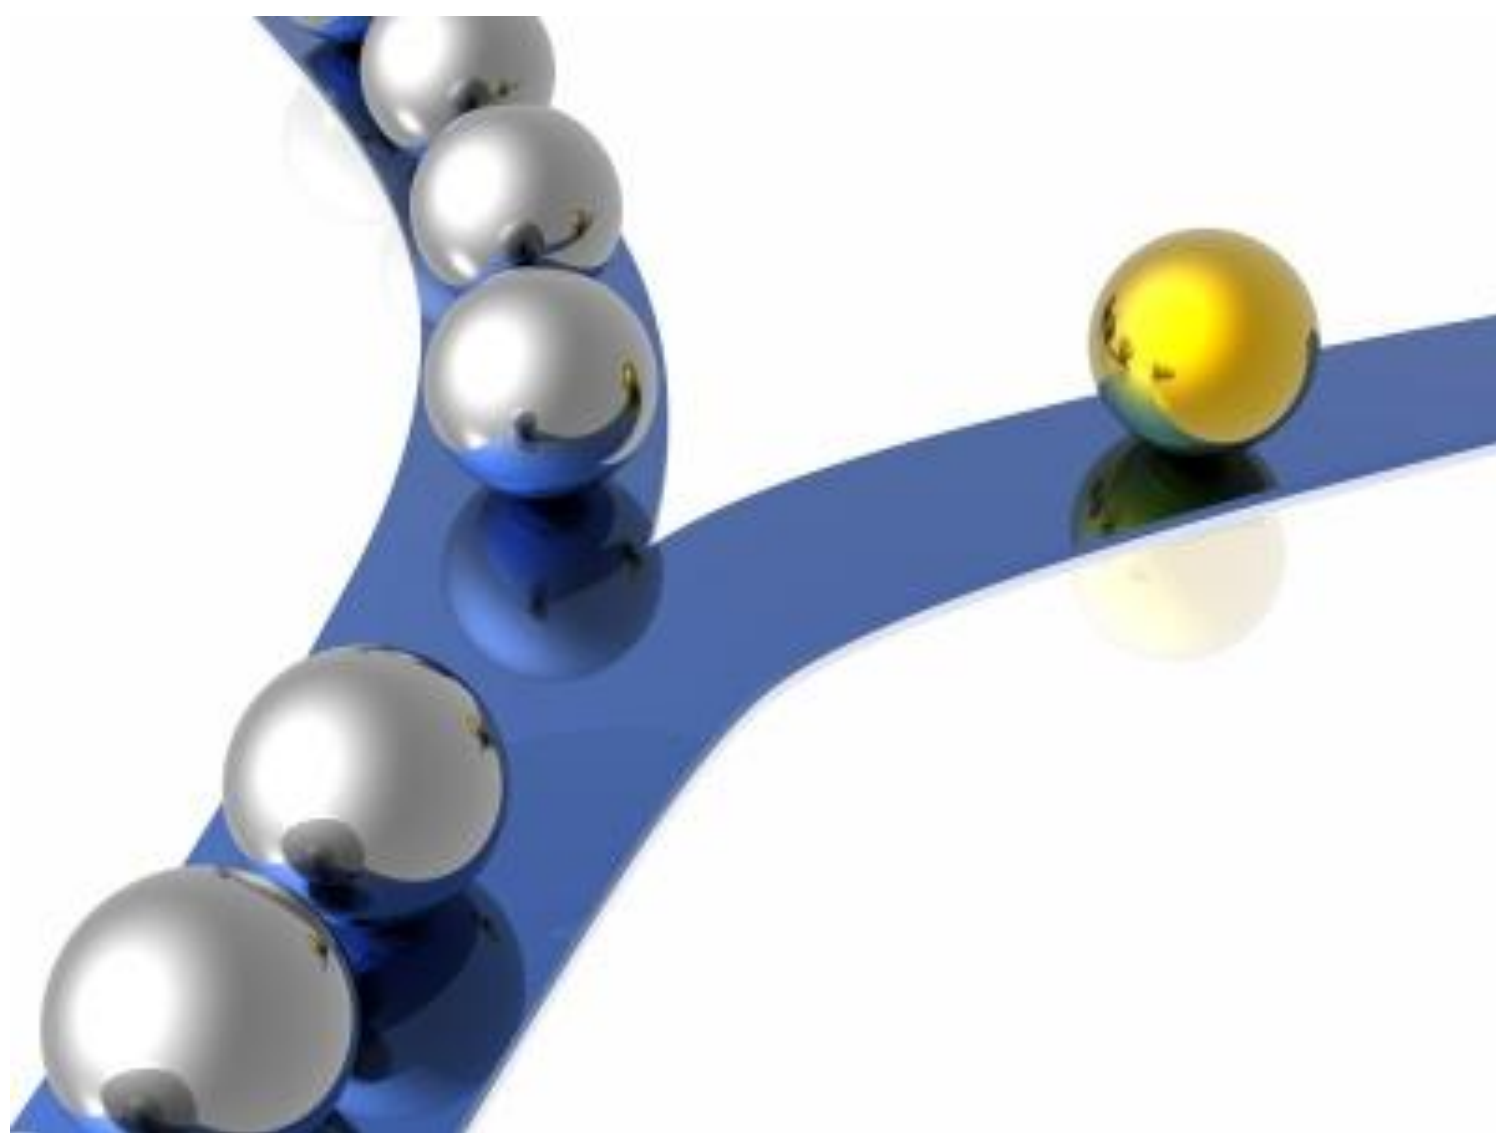

# Observation vs. maintenance rituximab therapy in rituximab-naïve patients treated with rituximab regimen.

## Problems:

Infusion reactions, increased risk of infections, hypogammaglobulinemia.

Major RR	88.2%	57.1%	28.6%	<0.01

Treon NEJM 2015

# Selected studies in untreated patients with Waldenstrom macroglobulinemia

Agent	N	Overall response rate	Major response rate	Time to response	Progression-free survival
Rituximab	29	66%*	48% (untreated and treated)	3-6 months	14 months
Bortezomib	27	85%*	48% (treated)	1.4 months	8 months
CDR	72	83%	74% (untreated)	4 months	35 months
BDR twice weekly	23	96%	83% (untreated)	1.4 months	66 months
BDR once weekly	38	85%	68% (untreated)	Not reported	42 months
Bendamustine/rituximab	22	Not reported	Not reported (untreated)	Not reported	69 months
CARD	31	87%	68% (untreated)	2.1 months	Not reached at 36 months

Castillo Ther Adv Hematol 2016

# Frontline clinical trials at DFCI

## **Ixazomib, dexamethasone, rituximab**

- N=26/26 enrolled
- 20 have completed induction treatment
- Minimal toxicity
- Overall response 80%
- Major response 50%

## **Ibrutinib**

- N=18/30 enrolled
- WGS in all patients on a yearly basis
- MYD88 +/- CXCR4

# Novel pathways: novel agents

- Oral proteasome inhibitors – ixazomib, marizomib
- BTK inhibitors – acalabrutinib, BGB-3111
- PI3K-delta – idelalisib, TG-1202
- BCL2 antagonism – venetoclax
- Anti-CD38 therapy - daratumumab
- Anti-CXCR4 therapy – ulocuplomab
- TLR inhibitor – IMO8400
- IRAK1/4 inhibitor
- MYD88 assembly inhibitor

# Summary

- There are multiple effective options for the frontline treatment of Waldenstrom Macroglobulinemia.
- Rituximab can be used as a single agent.
- Bendamustine, bortezomib, carfilzomib and cyclophosphamide are highly effective when combined with rituximab.
- Exciting clinical trials with oral agents are ongoing.
- Future treatments are likely to be less toxic and more effective.
